KODAK SV100 Color Video Print Set

KODAK SV100 Video Color Ribbon Cartridge contains a spooled web of clear polyester support with repeating patches of coated dye. Rectangular dye patches are coated in a yellow, magenta, cyan sequence. This dye-triplet pattern is repeated 100 times along the length of the ribbon.

KODAK SV100 Electronic Print Paper is a resin-coated paper material coated with a special "dye-receiving layer." The material is precut in 5.2 x 4.0-inch sheets, which are stacked and wrapped in packages of 100.

During the printing process, a sheet of electronic print paper is placed in intimate contact with a dye patch of the color ribbon, and then heated according to the desired density via the thermal head. The dye on the color ribbon sublimates and is absorbed by the "receiving layer" of the electronic print paper. This process continues until the entire image is printed in each of the three subtractive primary colors.
