

Introducing the magic
behind desktop publishing.

Meet POSTSCRIPT.®

You can't see it. Touch it. Or hear it. But the most powerful desktop publishing systems are all built around POSTSCRIPT.

It's never been easier, or more economical, to design, typeset, and print a whole page. Or a whole book. All you need is a POSTSCRIPT-equipped laser printer.

What is POSTSCRIPT? Simple. To print a page on a laser printer, your computer tells the printer what the page should look like, using a "page description language."

POSTSCRIPT is a page description language.

You use POSTSCRIPT every time you use software like *PageMaker*[®] from Aldus Corporation or Microsoft[®] *Word*, to produce everything from newsletters, to brochures, to CAD/CAM diagrams.

You need POSTSCRIPT to combine line art, text, and digitized photographs on the same page. In fact, as far as we can tell, anything you can dream up can be done.

Beware—laser printers that don't have POSTSCRIPT may not be able to do even basic desktop publishing functions. Those that can, still sacrifice some of the quality of a POSTSCRIPT-printed page.

And with POSTSCRIPT, you can pick and choose the best computer, software, and printer for your needs and budget, without making a once-and-for-all commitment to a single vendor.

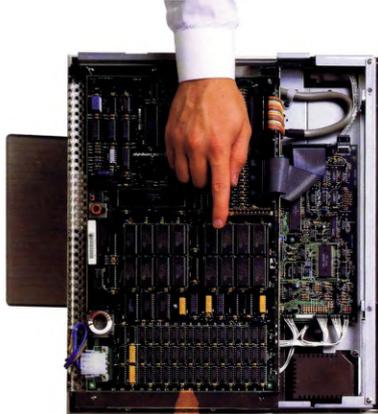

For most applications, you'll want to use your own laser printer to typeset and print your document. POSTSCRIPT is perfect for all desktop publishing purposes.

But the beauty of it is, commercial typesetters and printers now have POSTSCRIPT systems, too. So you can compose a page on your computer, then let the professionals typeset and print it. In less time and for less money than conventional layout and typesetting usually takes.

So depending on what you need, with POSTSCRIPT, you have a choice.

That's why hundreds of software companies have already published POSTSCRIPT application programs.

In fact, the brave new world of desktop publishing wouldn't be where it is today, if it wasn't for POSTSCRIPT. One thing we know for sure, this is only the beginning.

Before you buy a laser printer, make sure there's a POSTSCRIPT controller board inside. Without this powerful board, you can't use POSTSCRIPT. And without POSTSCRIPT, you aren't taking full advantage of desktop publishing.

More laser printers are equipped with POSTSCRIPT than any other page description language. This means you can choose the vendor you want, the printer resolution that best suits your needs, and still stay within your budget.

When we developed POSTSCRIPT, our theory was to give people a tool with unlimited flexibility. Here is an example of how you can make an ordinary photograph unique by using POSTSCRIPT.

The first desktop publishing system using POSTSCRIPT is introduced.

1985 1986

In one short year, leading software companies have recognized the importance of POSTSCRIPT and have introduced hundreds of software programs. This gives you an unbelievable selection of applications. Just take a look at this partial listing.

It's nearly impossible to show everything POSTSCRIPT can do. That's because, as far as we can tell, anything you dream up can be done. So whether it's a business report, bar graph, newsletter, or technical illustrations, it's up to you. POSTSCRIPT can handle it.

POSTSCRIPT.
All you need to know about
desktop publishing.
